

# Computational Neuroscience

Created on: 09-02-2023 - Last modified on: 13-02-2023

## Organisation

**Name of the organisation** Ghent University (UGent)

**Department** Information Technology

**Country** Belgium

**Geographical Area** Flemish Region

## SCOPE OF THE METHOD

<b>The Method relates to</b>	Human health
<b>The Method is situated in</b>	Basic Research, Translational - Applied Research
<b>Type of method</b>	In silico
<b>Specify the type of cells/tissues/organs</b>	Animal and Human Neurons

## DESCRIPTION

### Method keywords

computational models

in silico

Data analysis

prediction models

Neurons

### Scientific area keywords

computational modelling

neuroscience

bioengineering

Biomedical Engineering

### **Method description**

Computational neuroscience aims to study the nervous system by mathematical and computer simulations. Computational models can be built on multilevel scales. With the bottom-up approach, the model is built from the same building blocks as observed in human or animal tissue. As such, the functioning of a neuron depends on the behavior of its ion channels. Subsequently, these neurons are connected via synapses to obtain the network response. Ion channels and synapses are mathematically represented by a set of differential equations, modeled after the Hodgkin-and-Huxley formalism. The models enable simple and systematic parameter manipulation of often experimentally inaccessible aspects. They can therefore be used to test hypotheses concerning underlying mechanisms of neurological diseases on multilevel scale. New hypotheses can be formulated as well. The obtained results can be used to design more delineated *in-vivo* I *in-vitro* experiments, reducing the amount of experiments needed. Finally, they are an ideal tool to gain more insights in the effect of treatment strategies and provide improved treatment protocols.

### **Lab equipment**

- High performance cluster
- NEURON simulation software (open source)

### **Method status**

Still in development

Published in peer reviewed journal

## **PROS, CONS & FUTURE POTENTIAL**

### **Advantages**

- Systematic research
- Cost reduction
- Reduction *in-vivo* and *in-vitro* experiments
- Improved understanding of underlying mechanisms

- Generalization of sparse data \*Treatment optimization

## Challenges

- Validation of model assumptions / predictions / results
- Animal's *in-silico* model to human outcome translation
- Computational complexity / cost
- Simplified
- Intersubject variations

## Modifications

Increased computational power and better experimental methods will result in more accurate models.

## Future & Other applications

- Optimization of treatments for neurological diseases,
- Improved understanding of pathologies of nervous system diseases.
