

# Culturing HeLa cells

Created on: 20-03-2019 - Last modified on: 28-02-2022

### **Contact person**

Jessie Neuckermans

## Organisation

Name of the organisation Vrije Universiteit Brussel (VUB)

**Department** Pharmaceutical and Pharmacological Sciences

Specific Research Group or Service In Vitro Toxicology and Dermato-Cosmetology

**Country** Belgium

#### **SCOPE OF THE METHOD**

The Method relates to	Human health
The Method is situated in	Basic Research, Translational - Applied Research
Type of method	In vitro - Ex vivo
Specify the type of cells/tissues/organs	HeLa cells

### **DESCRIPTION**

## **Method keywords**

Culturing

Transfection

cell culture

cells

cancer cell line

#### mammalian

## Scientific area keywords

Cell culture

virus studies

cytotoxicity

transfection

### **Method description**

HeLa cells are the first continuous cancer cell line and were isolated from the aggressive glandular cervical cancer of a 31-year old woman. It was the first aneuploid line derived from human tissue maintained in continuous cell culture. Knowledge of almost every process that occurs in human cells has been obtained using HeLa cells. The cells should be handeld under laboratory containment level 2 and are identified as a contaminant in many other cell lines. Culture medium: EMEM + glutamine + NEAA + FBS; 5% CO2; 37 °C Growth mode: adherent Split subconfluent cultures (70 % - 80 %) 1:3 to 1:10, seeding at 1.3x10,000 cells/cm² using Trypsin.

#### Lab equipment

Biosafety cabinet;

Incubator;

Microscope;

T-flasks.

#### Method status

Still in development History of use

### PROS, CONS & FUTURE POTENTIAL

### **Advantages**

Stable genome after years of cultivation; Applying selection pressure is possible; Grow rapidly given the right medium and space.

# **Challenges**

Can infect other cells;
Can grow aggressively;
Avoid cross-contamination;
Use of serum.
