

# Fabrication of optofluidic and microfluidic devices

Created on: 29-08-2019 - Last modified on: 16-03-2022

# **Contact person**

Jürgen Van Erps

# **Organisation**

Name of the organisation Vrije Universiteit Brussel (VUB)

**Department** Faculty of Engineering

**Country** Belgium

Geographical Area Brussels Region

## **SCOPE OF THE METHOD**

The Method relates to	Animal health, Environment, Human health
The Method is situated in	Basic Research, Translational - Applied Research
Type of method	In silico

## **DESCRIPTION**

## **Method keywords**

hot embossing

micro-injection moulding
3D nanoprinting
microscaffolds

## Scientific area keywords

lab-on-chip

microfluidics

optofluidics

free-form optics

# **Method description**

Prototyping and replication (small series production) of microfluidic or optofluidic devices, in thermoplastic polymers or in glass. 3D nanoprinting is also available to produce microscaffolds, possibly within microfluidic channels.

## Lab equipment

Ultraprecision diamond tooling;

High-precision milling and grinding;

High-precision polishing;

Hot embossing;

(micro-)injection moulding;

Glass press moulding;

Two-photon polymerization-based 3D nanoprinting;

Femtosecond laser glass machining.

#### **Method status**

Internally validated

Published in peer reviewed journal

## PROS, CONS & FUTURE POTENTIAL

## **Advantages**

Custom-designed labs-on-chips can be fabricated (prototyped, or produced in small series), potentially including photonics structures (e.g. waveguides, lenses, ...) to allow for optical read-out integration. In addition, the produced optofluidic devices can be enhanced with 3D nanoprinting to produce custom scaffolds (e.g. for cell growth). In terms of materials, thermoplastic polymers (PMMA, PC, COC) or glass can be used.

## Challenges

Sealing of microfluidic channels is sometimes challenging. Depending on the material used, several approaches are possible (laser welding, thermal bonding, chemical bonding,...).

#### **Modifications**

Our fabrication technologies are very flexible and allow a large design freedom.

## **Future & Other applications**

The fabrication technologies are also used in other areas, such as high-end free-form optics for imaging or non-imaging applications.
